FINAL REPORT

GRANT # N00014-89-J-3047

R&T CODE: 441h001

PRINCIPAL INVESTIGATOR: Leo W. Buss

INSTITUTION: Yale University

REPORTING PERIOD: 1 July 1989 - 30 June 1992

**OBJECTIVE:** To determine the transmission dynamics of cnidarian allorecognition using standard breeding experiments and to identify, isolate, and clone the genes controlling allorecognition using molecular methods.

**ACCOMPLISHMENTS and SIGNIFICANCE:** Our work to date has demonstrated the existence of no less than three additional allorecognition segregant classes in F1 offspring of *Hydractinia echinata*. These results essentially obviate all prior interpretations of the genetics of cnidarian allorecognition as grossly oversimplified. In addition, the laboratory has (see references below) (1) reported the first homeoboxes from cnidarians, (2) used mtDNA conformation to demonstrate that Anthozoa are the primitive cnidarian class, (3) used rDNA sequence to establish that king crabs are derived from hermit crabs, (4) shown that medusae production is a repeated evolutionary event within the Hydrozoa, and (5) developed an experimental basis for the study of heterochrony.

**INVENTIONS:** None

**PUBLICATIONS AND REPORTS:** The following publications cite ONR support on this project.
